

Pass the gold through and the quarter reads 2.7 points weaker, then 5.1 stronger

Net US imports of gold, and what a GDP figure built straight off the trade data would print. Published GDP is not this: BEA removes nonmonetary gold from the national accounts. These are the bars a trade-driven estimate gets, and a nowcast is one

Gold is US imports minus exports of HS 7108 and 7115, all partners, converted to tonnes at the LBMA PM benchmark and valued at the previous quarter's price. That contribution is what the trade figure implies for GDP growth. It is NOT what published GDP did: BEA removes nonmonetary gold from the national accounts and replaces it with domestic production less industrial use. The red bars are the error available to anyone reading GDP off trade data. Complete quarters only
