

Four months brought in more gold than the previous decade sent out

Net gold shipped to the United States each month, both headings, tonnes derived from customs value. Red is net in, grey net out.

December 2024 to March 2025 ran 867 tonnes in, against 502 tonnes net exported over the 119 months before it;

105 of the 139 months in the sample are net out. The 2020 dislocation did much the same thing, 691 tonnes over 5 months

Gold is US imports minus exports of HS 7108 and 7115, all partners. Census reports value and not mass for these headings, so tonnage is DERIVED: the month's customs value divided by that month's LBMA PM benchmark. Measured on the US side, it will not agree to the tonne with the Swiss and UK export returns, which carry mass directly
