

The same trade, measured twice - and the two sides break in different quarters

Same agency, same transactions. The only difference is whether bullion counts as trade

a. US goods imports, \$bn at an annual rate

The ITA counts nonmonetary gold; the national accounts do not. In 2025Q1 the two were \$329bn apart

b. US goods exports, \$bn at an annual rate

The export side breaks later, when the metal went back out. The largest gap is \$202bn
