

One leg is priced. The other barely is

Swiss customs gold trade with the United States against the New York premium. Each dot is one month, January 2023 to July 2026

Estimated from January 2023 forward: 2020 and the 2022 sanctions shock are location dislocations of a different kind, and folding them in widens the claim past what this paper argues. It costs precision, not the result - the full 2015-2026 series puts the westward threshold at \$2.99 against \$3.77 here. Method: a continuous kink, tonnes = a + b1(x-g) + b2 max(0, x-g), with g by profile least squares, 15% trimmed from each regime, and a 90% interval from 2,000 iid and moving-block bootstrap replications. On 43 months that interval runs \$0.83 to \$10.25, so the threshold is well located and poorly pinned. Westward: R-squared 0.38 against 0.27 for a straight line, and a slope of 0.5 tonnes per dollar below the threshold against 7.8 above it. Eastward: R-squared 0.13 against 0.01, correlation -0.11, and a threshold interval of -\$2.69 to +\$4.65 that spans zero. Its downward slope where New York is at a discount rests on nine months: report it, do not rely on it.
