

The record deficits, and the collapse that followed, were both largely bullion

US goods and services deficit as published each month, and with nonmonetary gold taken out of both sides. Gold is 26% of the January 2025 record and 41% of October 2025, the smallest deficit in six years. It nets out only slowly, so the twelve-month deficit was wrong too - by \$79bn at its worst

The published balance is BEA and Census, FT-900, goods and services, balance-of-payments basis. Gold is US imports minus exports of HS 7108 and 7115, all partners, and is subtracted from both sides of that same balance, so the two lines differ by the gold and by nothing else. The deficit is plotted as a positive number, so up is wider. The gold series starts in October 2023, which is where the customs pull starts, and the lower panel therefore starts twelve months after that
