

For two months the Fed's own nowcast ran 2.1 points low on gold alone

GDPNow for 2025Q1 minus the Atlanta Fed's gold-adjusted GDPNow, every vintage, on the same axis as the excess-trade panel.

Negative means the headline nowcast was that much weaker than the model that takes the gold out

Drawn only where both models exist. The Atlanta Fed ran a gold-adjusted GDPNow beside the standard one for 2025Q1 alone; on 30 April 2025 the gold-adjusted model became GDPNow and the old one was discontinued, so outside that window there is no second model to difference and the line is left as a gap rather than drawn at zero
