

Stripping the gold out moved the nowcast by about 2 points, for two months

GDPNow for 2025Q1, every vintage. The standard model fell from +2.3% to -2.8% in three working days, on two trade releases.

The Atlanta Fed's gold-adjusted model, run alongside it from 6 March and made the standard model on 30 April, spent March between -0.6% and +0.4%

The wedge is the gold-adjusted nowcast minus the standard one. The two adjustments are not the same object: the Atlanta Fed strips gold out of the trade data its bridge equations extrapolate from, so an unrepeatable spike is not carried into the unobserved months, while observed gold still enters GDP; this project removes the arithmetic contribution of net gold trade outright. The second is the larger cut and answers the different question of how much of the number is metal moving between vaults
