

Gold made GDP look 2.7 points too weak, then 5.1 points too strong

Net US imports of gold, and what they contributed to annualised real GDP growth if nothing in the accounts offsets them. Arriving metal is an import, so it subtracts; the same metal leaving a quarter later adds it all back

Gold is US imports minus exports of HS 7108 and 7115, all partners, converted to tonnes at the LBMA PM benchmark and valued at the previous quarter's price. The contribution assumes no offsetting entry anywhere else in the accounts; if the metal was booked as inventory investment, as some of it was, published GDP is unaffected and only its composition is wrong. Complete quarters only
